This doc are some recommended resources for further research of the project.

1. RTMP Panoramic video player:

    Kapano is a library which has the potential to live streaming panoramic video through RTMP protocol.

    There are two posts on their official forum mention the possible set up:

    https://krpano.com/forum/wbb/index.php?page=Thread&threadID=14460

   https://krpano.com/forum/wbb/index.php?page=Thread&threadID=6720

    However, since those posts are posted years ago, even if I follow the instructions, the whole set up doesn't work on current version.

    Kapano Javascript library: https://krpano.com/download/

    The js file could be found at templates/xml/plugins

    Mxreality is a panoramic vr player which is quite similar to the videojs-vr library we use, the github repository link is: https://github.com/guoguicheng/mxreality.js

2. Stream Server:

    Wowza is a potential replacement for Nginx as streaming server.

    It's a professional business software for live video streaming. Download Link: https://www.wowza.com/pricing/installer

    Official guide:
